

Getting Started

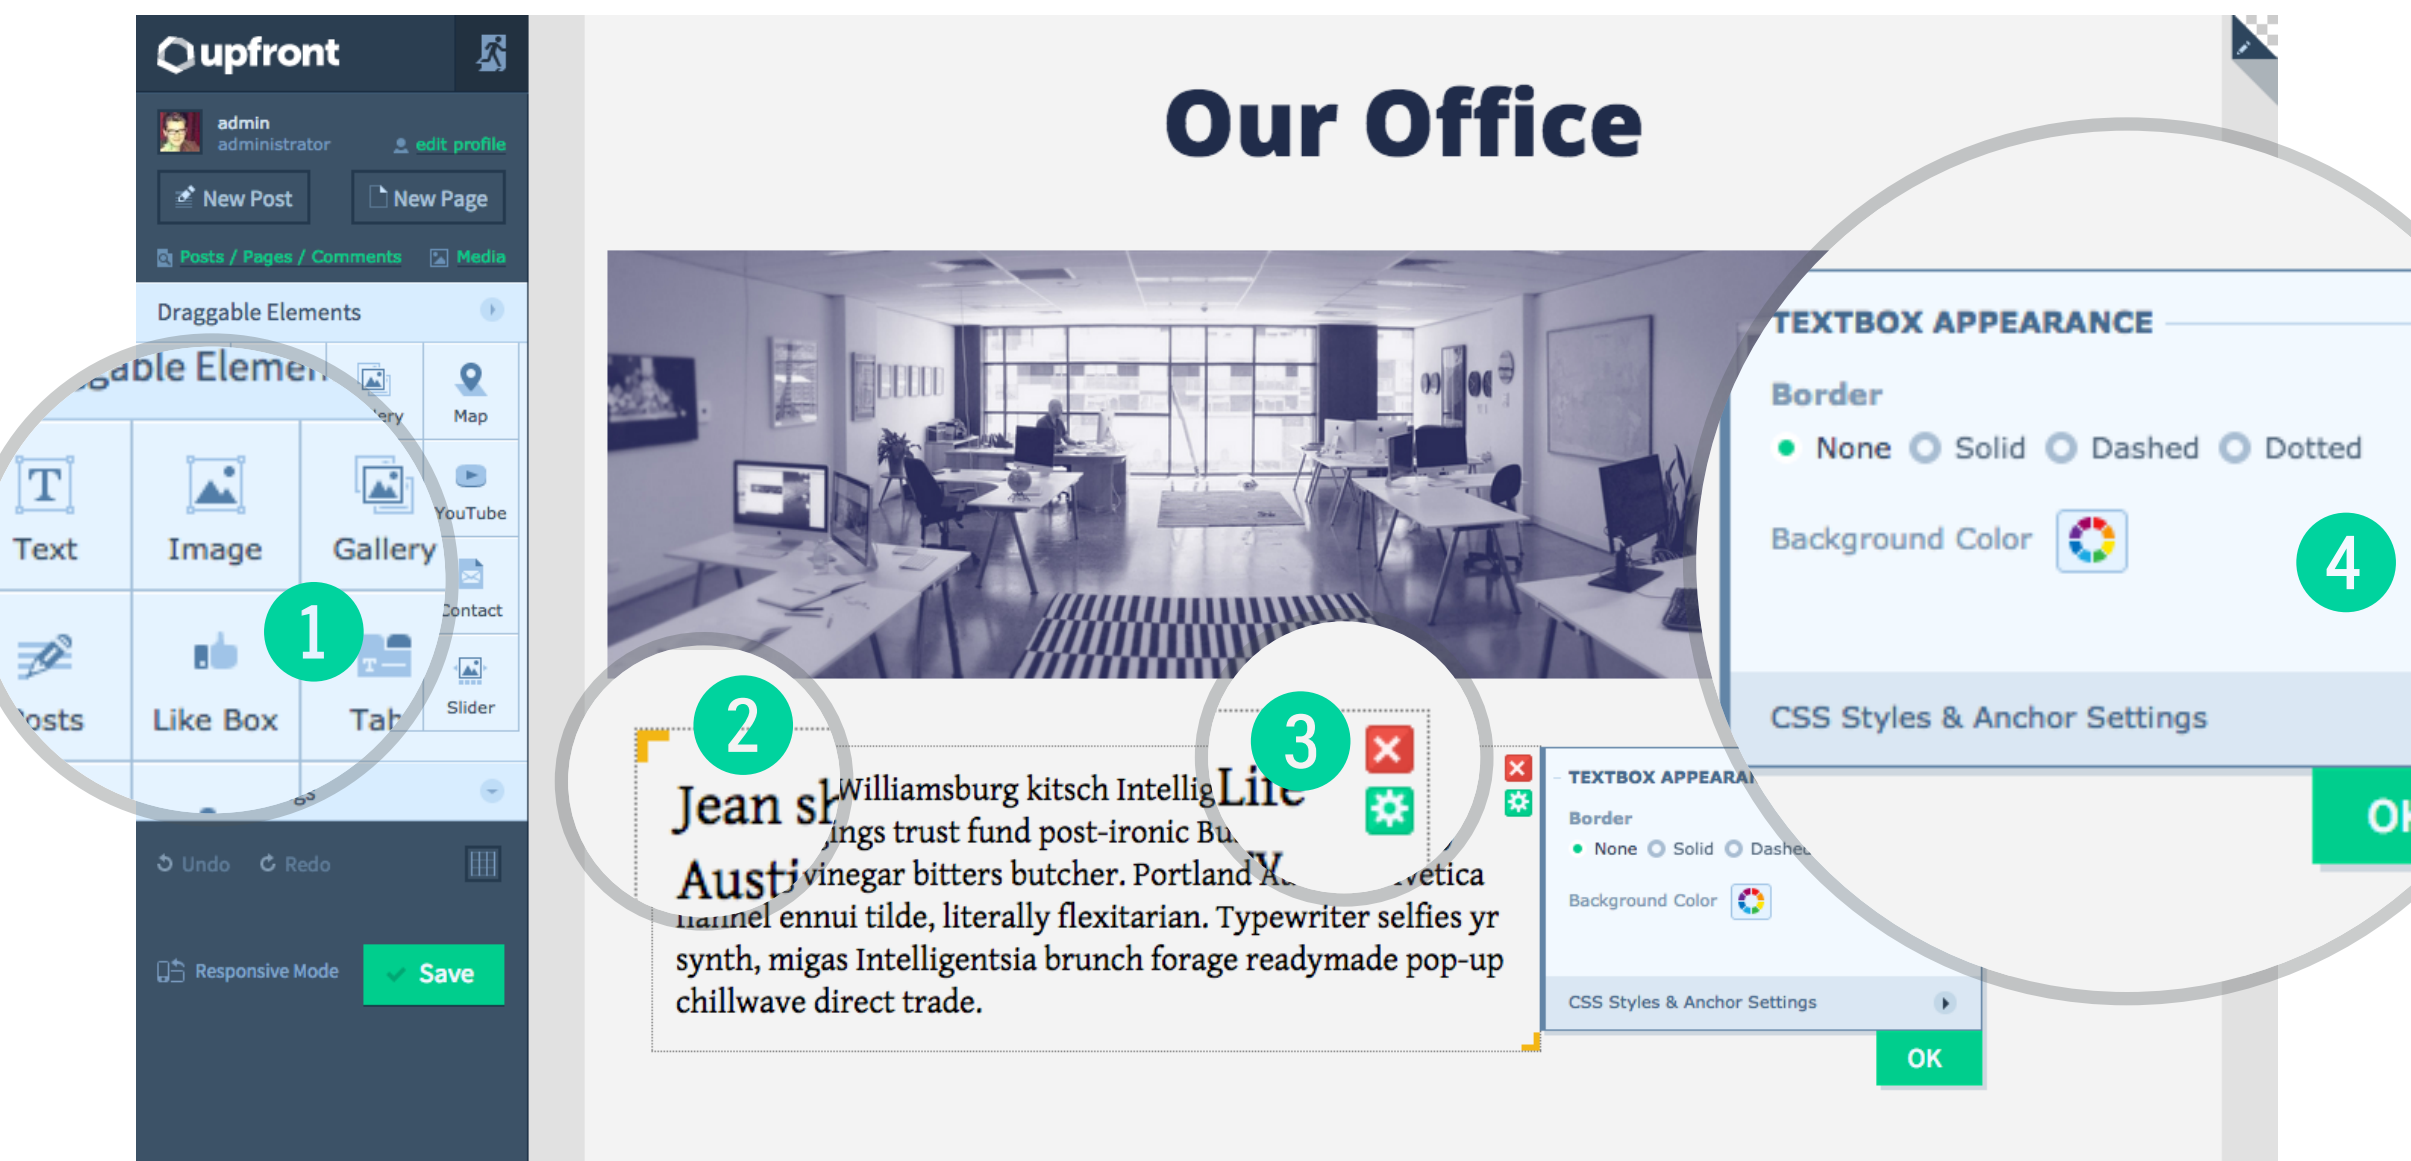

1. Installation
2. Elements
3. Regions
4. Text Editing
5. Custom CSS
6. Other Features

- 1 Add **Upfront** and **Spirit** themes to your themes directory
- 2 Activate **Spirit** theme (do not activate Upfront)
- 3 Click **Upfront** in your admin bar to launch Upfront

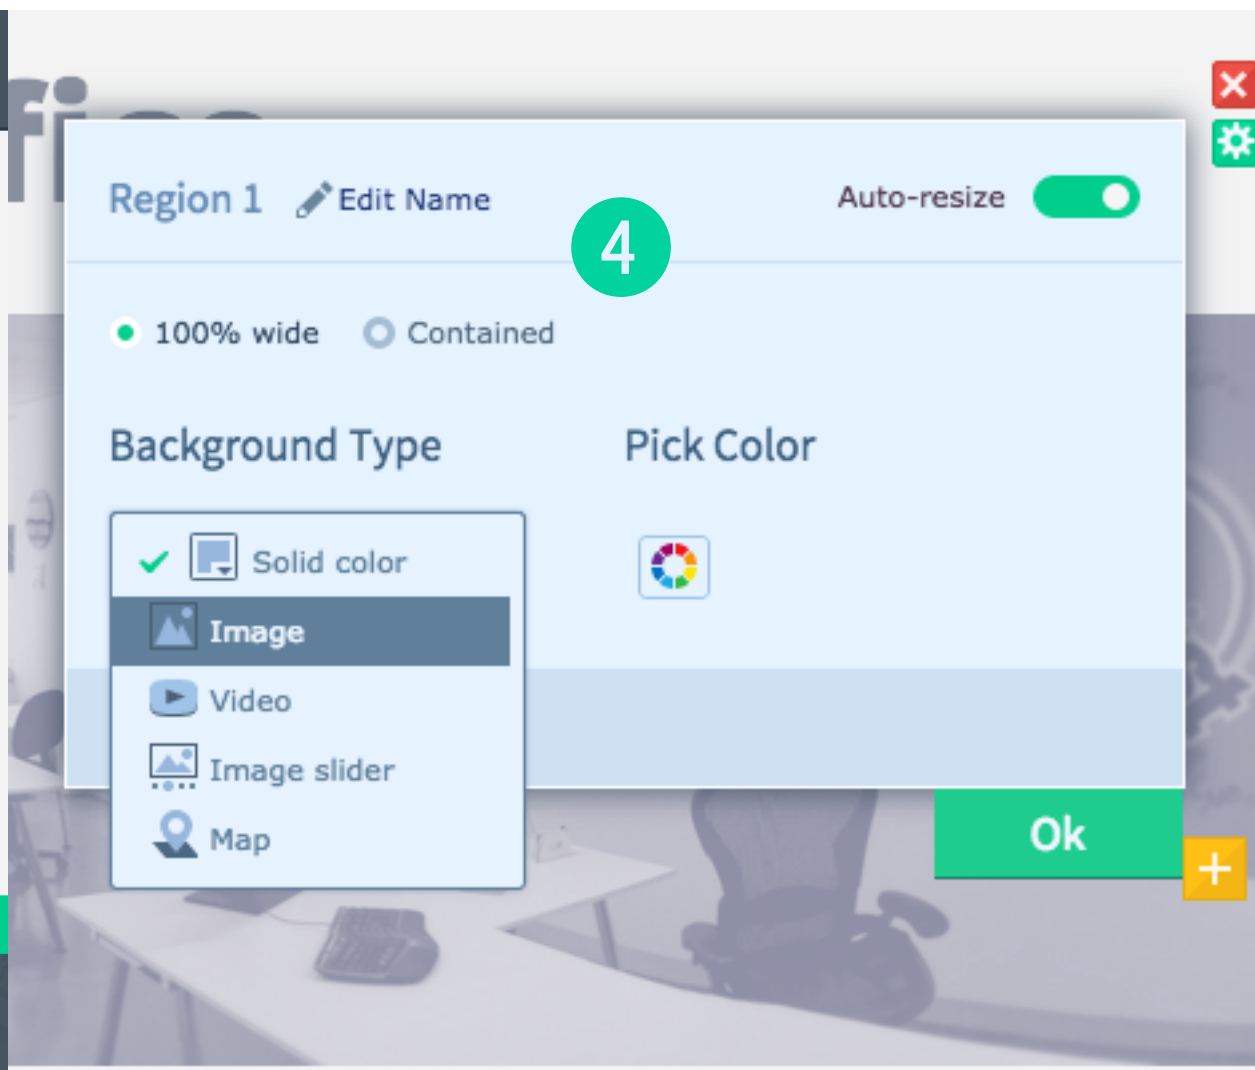

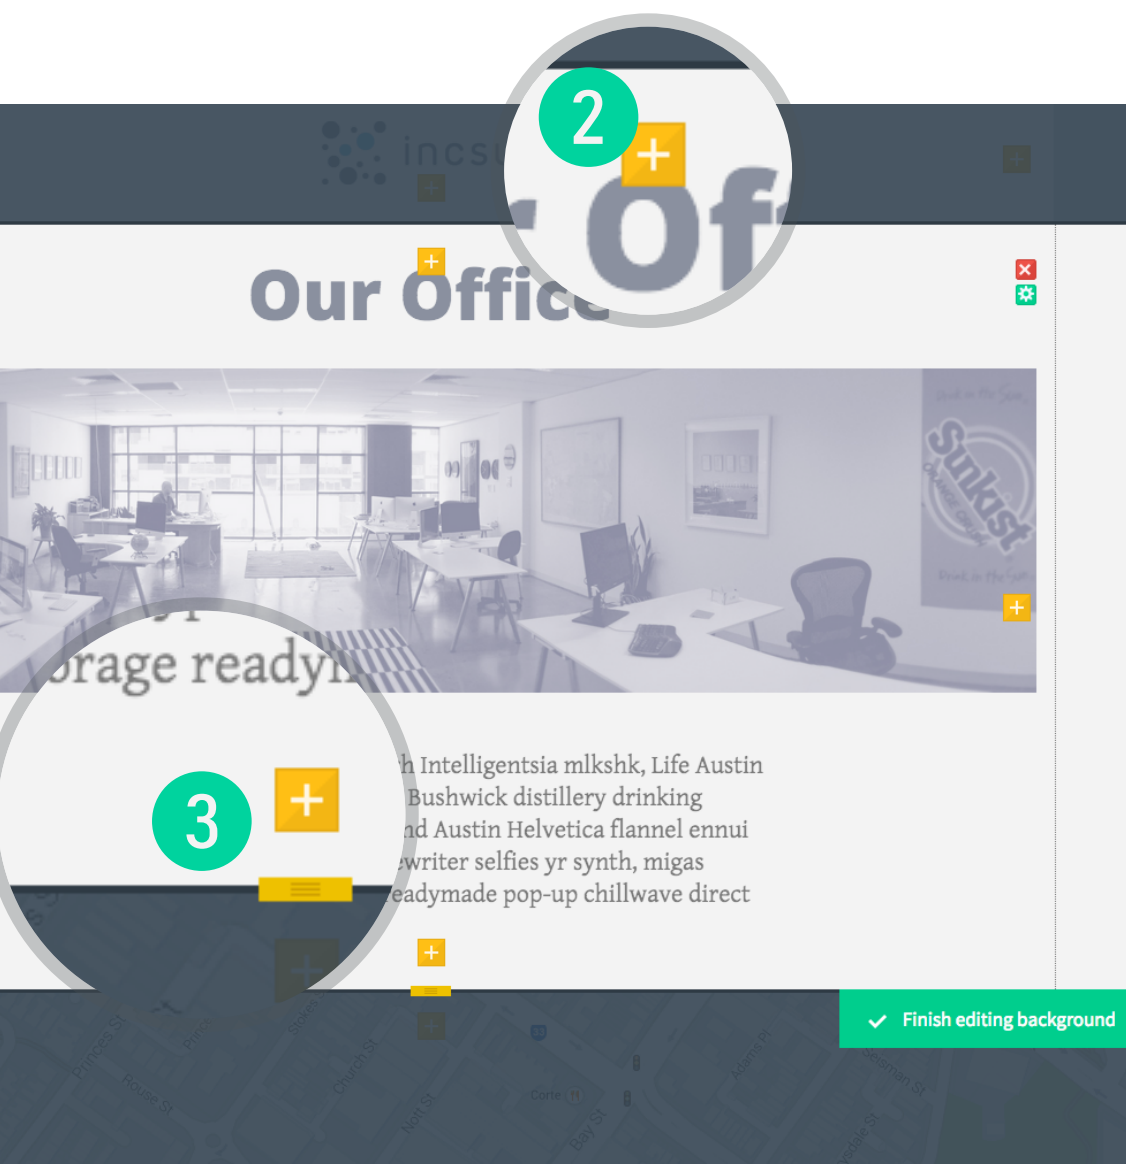

One of the fundamental concepts of Upfront is the Elements. Elements are self-contained pieces of functionality. You would use Elements to add things like Sliders, Galleries, Images & Text to your layouts. Elements are the building blocks of your pages. Each element has a 'Settings' panel where you can further configure the appearance / functionality. Elements are added to your page via drag-and-drop. They can then be re-sized and positioned anywhere you like.

- 1 Upfront Elements. Drag those from the sidebar onto your page.
- 2 Element re-size handles, use them to re-size elements
- 3 Delete Element & Element Settings
- 4 Element Settings Panel

Regions allow you to configure the areas that contain your Elements.
Colors, Images, Sliders and Maps can be applied as Region Backgrounds.
This allows you to be even more creative when building your pages.

- 1 Enter Region Editing Mode by clicking the trigger in the top-right corner of the region
- 2 Add Regions Above / Below current Region or add sidebars to the current Region
- 3 Re-size current Region to your desired height
- 4 Change the background type for selected Region from it's settings panel

3. Regions

Upfront is designed to provide you with intuitive Rich Text Editing experience. Double click on a text element and just begin typing. When you select a word or a group of words, a panel with various options will appear.

More advanced users can take advantage of the Custom CSS functionality. Any of the Upfront Elements, can be subverted by accessing Custom CSS from inside Element Settings panel. Each Element provides a set of selectors that can be used to modify the appearance of the element. Your Custom CSS modifications can be saved and re-used across other elements of the same type.

- 1 Click 'Add New Style' in the Element CSS Styles panel
- 2 A CSS panel will appear at the bottom
- 3 Use selectors on the right-side to style your element
- 4 Give your style a name & save it

There are plenty more features in Upfront. You can clone and group Elements, create and modify responsive layouts for different devices, create lightboxes and so on. We hope you enjoy discovering those, and using them to speed up your website authoring process.

- 1 Right Click anywhere to get a contextual menu
- 2 Use a Visual Grid button to help you align your elements
- 3 Make your pages slick for different devices with Responsive Mode

6. Other Features
